

■ Immobilization device for medulloblastoma treatment

■ Our immobilisation device for Medulloblastoma treatment is made from radio-transparent material and could be laid down on any model of treatment or simulation couch.

■ Frequently used for children, it is fitted with multiple adjustment mechanisms in order to adapt it for the adults as well.

■ All the positions are adjustable and reproducible. Used with the patient in abdominal decubitus position, it includes 2 parts:

- one part is made up of one tilting plate for the chest and endowed with multiple adjustment mechanisms,
- the other part is made up of one support for the head and is adjustable in height.

ref. : AR80
