MAMMA STEP

The new MAMMA STEP enables perfect immobilisation, precise repositioning and highest comfort in the routine breast fixation.

The immobilisation system is a novel device designed to improve the accuracy of the radiation therapy of the breast, thorax and upper abdomen in a patient friendly and non-invasive manner.

This progressive patient fixation system allows for comfortable positioning whenever accurate and reproducible immobilisation is an essential prerequisite for optimised therapy schedules.

The MAMMA STEP is a breast board that consists of a base plate, adjustable arm and wrist support, a bottom stop and an upper plate made of low density foam core covered with thin layers of carbon fiber, a bottom stop and an indexing system.

Advantages

Perfect Immobilisation and Precise Repositioning

Minimizes patient movements of arms and wrists

Highest Comfort in Breast and Thorax Positioning

Allows pain free comfortable patient positioning

Reproducible arm and wrist support

- # 8 different upper plate heights, in 5° steps
- # Arm support - height adjustment with 3 numbered positions
- # Arm support - rotatable in 6 numbered positions (15° steps)
- # Wrist support - height adjustment with 2 different positions
- # Wrist support - 4 numbered positions in 30° steps

Easiest Handling and High Quality Integrated Indexing System
